XhoI; Library Gm-r1021 is a sequence-driven, reracked set
of the original library Gm-c1004 which was prepared from
root cDNA, The mRNA was isolated from entire roots of 8
day old 'Williams' seedlings which were propagated on
paper towels with distilled water. Stratagene's CDNA
Synthesis Kit (catalog #200401) was used to synthesize
the cDNA. The Gm-c1004 library was constructed by Dr.
Paul Keim & Virginia H. Coryell, Department of Biology,
Box5640, Northern Arizona University, Flagstaff, Az
86011, email: paul keiménau.edu, virginia.coryell@nau.edu.
The contig analysis to select unique genes was performed
by the laboratory of Ernest Retzel, Computational Biology

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                80
                               Washington), Genscan (Chris Burge,
http://gnomic.stanford.edu/-chris/ENNSCANW.html), and NetPlantGene
(http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html), searches of the
(http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html), searches of the
complete sequence against a peptide database and the Arabidopsis
EST database at TIGR (http://www.tigr.org/tdb/at/at.html).
Annotated genes are named to indicate the level of evidence for
their annotation. Genes with similarity to other proteins are named
after the database hits. Genes without significant peptide
similarity but with EST similarity are named as 'unknown' proteins.
Genes without protein or EST similarity, that are predicted by more
than two gene prediction programs over most of their length are
annotated as 'hypothetical' proteins. Genes encoding tRNAs are
predicted by tRNAscan-SE (Sean Eddy,

BAC clone F978 is from Arabidopsis chromosome III and is near the
molecular marker g4547.
The orientation of the sequence is from SP6 to T7 end of the BAC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Submitted (09-SEP-1999) The Institute for Genomic Research, Medical Center Dr, Rockville, MD 20850, USA, xlin@tigr.org 3 (bases 1 to 101284)

On Feb 11, 2000 this sequence version replaced g1:6693723.
The sequence is of BAC F14D7 from Arabidopsis thaliana chromosome
1. The sequence does not represent the sequence of the entire
insert of this clone. It is shorter by 6954 bp because we submit
only the unique sequence of the clone. However, in order to
facilitate the joining of overlapping clones in the future for
creation of larger contigs, we provide small overlaps (200 bp)
between overlapping sumbitted clones. The 5' end of this sequence
overlaps by 200 bp to the 3' end of the sequence of the clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 (bases 1 to 81513)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       549
                 Genes were identified by a combination of three methods: Gene prediction programs including GRAII (available by anonymous ftp from arthur.epm.ornl.gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/~chris/GENSCANW.html), and NetPlantGene (http://gnomic.stanford.edu/~chris/GENSCANW.html), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (http://www.tigr.org/tdb/at/at.html). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/). Simple repeats are identified by repeatmasker (Arian Smit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       caatccc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cactcactgcaatcccaagccttaaagttgttgatgtctcaagcaatgatttgtgtggaa 548

                                                                                                                                                                                                                              Production of apomictic seeds - useful in plant breeding Claim 27; Pages 91-95; 123pp; English.

The sequence is that encoding SERK, a putative receptor kinase. The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity plant parts; and (c) expressing the sequence in the vicinity plant proyeny. This is useful in plant can be developed into plant proyeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides the case that sexual plants are available as crosses with the case that sexual plants are available as crosses with the propagated hybrids and could shorten and simplify the breeding programs of propagated hybrids and could shorten and simplify the breeding programs allows plant breeders to develop cultivars with Apomixis allows plant breeders to develop cultivars with specific stable traits for such characteristics as height, seed and forage quality and maturity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
Production of apomictic seeds - useful in plant breeding production of apomictic seeds - useful in plant breeding production 21; Pages 47-51; 123pp; English.

Comprising: Is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nuclectide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced containing programs. Controllable and reproducible apomixis provides the case that sexual plant pargument and cultivar development in the case that sexual plants are available as crosses with the apomixic plant. Apomixis provides for true-breeding, seed propagated hybrids and could shorten and simplify the breeding containing and program testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with containing the plant traits for such characteristics as height,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               14-MAY-1996; GB-010044.

DNA encoding plant morphogenesis regulatory protein - useful to yield plants with short stems or altered inflorescence Claim 1; Pages 6-10; 17pp; Japanese.

The present sequence encodes an Arabidopsis thaliana plant morphogenesis regulatory protein (MRP), which can be used to yield a plant with, e.g. short stems or altered inflorescence. The MRP acts on a plant at a specific site for a specific period, and can therefore be used to regulate extraneous gene expression in a plant. The MRP's CDNA or genomic DNA can be used to transform a plant to increase its MRP expression, and therefore control the form (particularly stem length) of the plant.
